Features

- High-performance, Low-power AVR® 8-bit Microcontroller
 - 130 Powerful Instructions Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers
 - Fully Static Operation
 - Up to 8 MIPS Throughput at 8 MHz
 - On-chip 2-cycle Multiplier
- Nonvolatile Program and Data Memories
- Self-programming In-System Programmable Flash Memory
 - 16K Bytes with Optional Boot Block (256 2K Bytes)
 Endurance: 1,000 Write/Erase Cycles
 - Boot Section Allows Reprogramming of Program Code without External Programmer
 - Optional Boot Code Section with Independent Lock Bits
 - 512 Bytes EEPROM
 - Endurance: 100,000 Write/Erase Cycles
 - 1024 Bytes Internal SRAM
 - Programming Lock for Software Security
- · Peripheral Features
 - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
 - One 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
 - Real Time Clock with Separate Oscillator and Counter Mode
 - Three PWM Channels
 - 8-channel, 10-bit ADC
 - Byte-oriented Two-wire Serial Interface
 - Programmable Serial UART
 - Master/Slave SPI Serial Interface
 - Programmable Watchdog Timer with Separate On-chip Oscillator
 - Analog Comparator
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated RC Oscillator
 - External and Internal Interrupt Sources
 - Four Sleep Modes: Idle, ADC Noise Reduction, Power-save, and Power-down
- Power Consumption at 4 MHz, 3.0V, 25°C
 - Active 5.0 mA
 - Idle Mode 1.9 mA
 - Power-down Mode < 1 μA
- I/O and Packages
 - 32 Programmable I/O Lines
 - 40-pin PDIP and 44-pin TQFP
- Operating Voltages
 - 2.7 5.5V for ATmega163L
 - 4.0 5.5V for ATmega163
- Speed Grades
 - 0 4 MHz for ATmega163L
 - 0 8 MHz for ATmega163

8-bit AVR®
Microcontroller with 16K Bytes In-System
Programmable Flash

ATmega163 ATmega163L

Summary

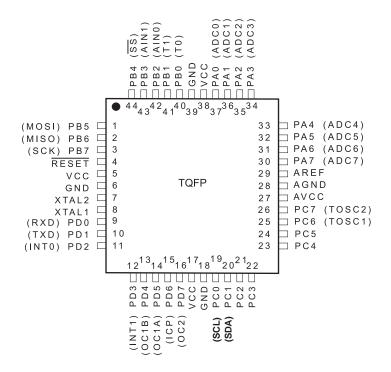

Not Recommend for New Designs. Use ATmega16.

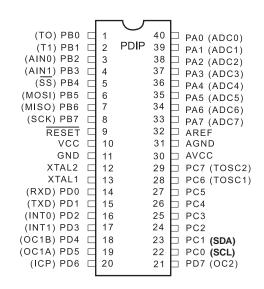

Rev.1142ES-AVR-02/03

Pin Configurations

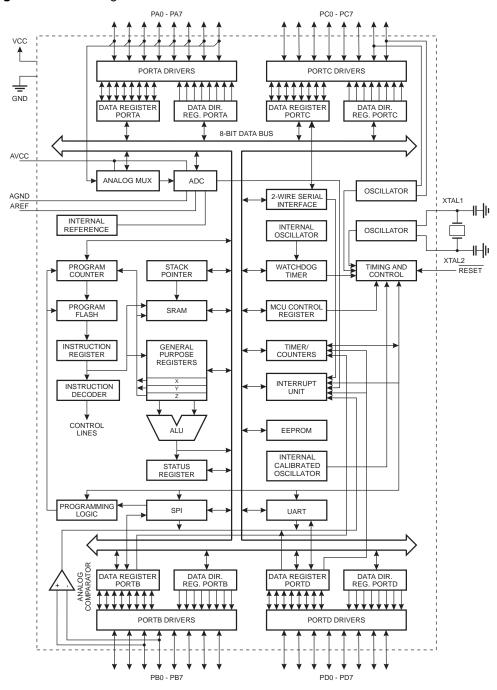

Description

The ATmega163 is a low-power CMOS 8-bit microcontroller based on the AVR architecture. By executing powerful instructions in a single clock cycle, the ATmega163 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Block Diagram

Figure 1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock

cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega163 provides the following features: 16K bytes of In-System Self-Programmable Flash, 512 bytes EEPROM, 1024 bytes SRAM, 32 general purpose I/O lines, 32 general purpose working registers, three flexible Timer/Counters with compare modes, internal and external interrupts, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC, a programmable Watchdog Timer with internal Oscillator, a programmable serial UART, an SPI serial port, and four software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous Timer Oscillator continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer and ADC, to minimize switching noise during ADC conversions.

The On-chip ISP Flash can be programmed through an SPI serial interface or a conventional programmer. By installing a Self-Programming Boot Loader, the microcontroller can be updated within the application without any external components. The Boot Program can use any interface to download the application program in the Application Flash memory. By combining an 8-bit CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega163 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega163 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, In-Circuit Emulators, and evaluation kits.

Pin Descriptions

VCC Digital supply voltage.

GND Digital ground.

Port A (PA7..PA0) Port A serves as the analog inputs to the A/D Converter.

Port A also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port A output buffers can sink 20mA and can drive LED displays directly. When pins PA0 to PA7 are used as inputs and are externally pulled low, they will source current if the internal pull-up resistors are activated. The Port A pins are tristated when a reset condition becomes active, even if the clock is not running.

Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers can sink 20 mA. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. Port B also serves the functions of various special features of the ATmega83/163 as listed on page 117. The Port B pins are tristated when a reset condition becomes active, even if the clock is not

running.

Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers can sink 20 mA. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tristated when a reset condition becomes active, even if the clock is not running.

4 ATmega163(L)

Port C also serves the functions of various special features of the ATmega163 as listed on page 124.

Port D (PD7..PD0) Port D is an 8-bit bidirectional I/O port with internal pull-up resistors (selected for each

bit). The Port D output buffers can sink 20 mA. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. Port D also serves the functions of various special features of the ATmega163 as listed on page 128. The Port D pins are tristated when a reset condition becomes active, even if the clock is not

running.

RESETReset input. A low level on this pin for more than 500 ns will generate a Reset, even if

the clock is not running. Shorter pulses are not guaranteed to generate a Reset.

XTAL1 Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

XTAL2 Output from the inverting Oscillator amplifier.

AVCC This is the supply voltage pin for Port A and the A/D Converter. It should be externally

connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter. See page 105 for details on operation of the

ADC.

AREF is the analog reference input pin for the A/D Converter. For ADC operations, a

voltage in the range 2.5V to AVCC can be applied to this pin.

AGND Analog ground. If the board has a separate analog ground plane, this pin should be con-

nected to this ground plane. Otherwise, connect to GND.

Register Summary (Continued)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Page
\$00 (\$20) TWBR Two-wire Serial Interface Bit Rate Register								82		

Note:

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. Some of the Status Flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
	D LOGIC INSTRUC		operation.	· iago	" Olooko
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	Rdh:Rdl ← Rdh:Rdl + K	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	Rd ← Rd - Rr	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	Rd ← Rd - K	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	Rd ← Rd - Rr - C	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	Rd ← Rd - K - C	Z,C,N,V,H	1

CLH	Clear Half Carry Flag in SREG	H ← 0	Н	1
NOP	No Operation		None	1
SLEEP	Sleep	(see specific descr. for Sleep function)	None	1
WDR	Watchdog Reset	(see specific descr. for WDR/timer)	None	1

Ordering Information

Speed (MHz)	Power Supply	Ordering Code	Package	Operation Range
4	2.7 - 5.5V	ATmega163L-4AC ATmega163L-4PC	44A 40P6	Commercial (0°C to 70°C)
		ATmega163L-4AI ATmega163L-4PI	44A 40P6	Industrial (-40°C to 85°C)
8	4.0 - 5.5V	ATmega163-8AC ATmega163-8PC	44A 40P6	Commercial (0°C to 70°C)
		ATmega163-8AI ATmega163-8PI	44A 40P6	Industrial (-40°C to 85°C)

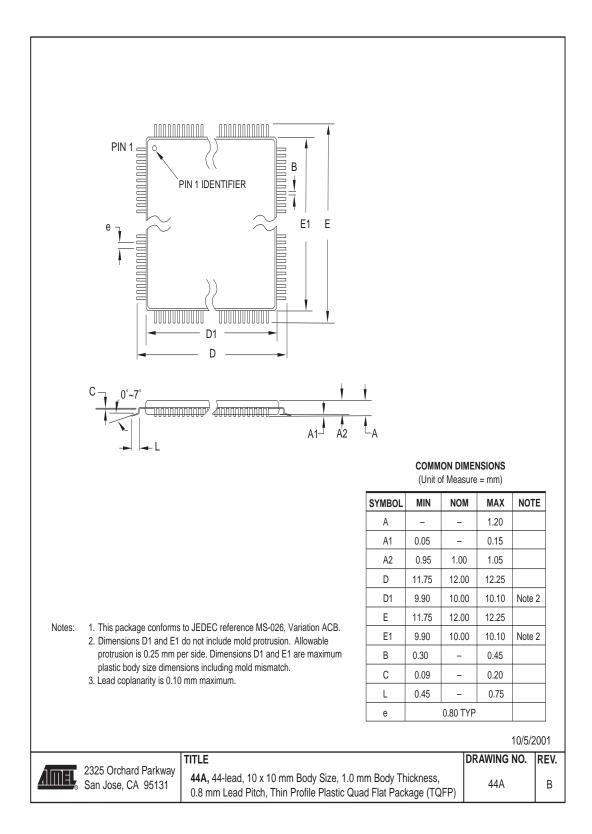

Package Type						
44A	44-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)					
40P6	40-lead, 0.600" Wide, Plastic Dual Inline Package (PDIP)					

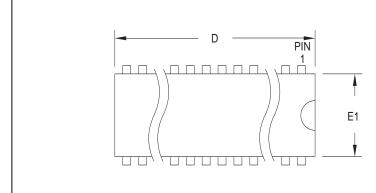

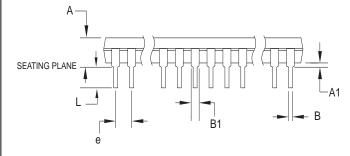

Packaging Information

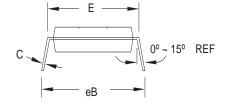

44A

40P6

Notes:

- 1. This package conforms to JEDEC reference MS-011, Variation AC.
- Dimensions D and E1 do not include mold Flash or Protrusion.
 Mold Flash or Protrusion shall not exceed 0.25 mm (0.010").

COMMON DIMENSIONS

(Unit of Measure = mm)

SYMBOL	MIN	NOM	MAX	NOTE
Α	_	-	4.826

Erratas

ATmega163(L) Errata Rev. F

- Increased Interrupt Latency
- Interrupts Abort TWI Power-down
- TWI Master Does not Accept Spikes on Bus Lines
- TWCR Write Operations Ignored
- PWM not Phase Correct
- TWI is Speed Limited in Slave Mode

6. Increased Interrupt Latency

In this device, some instructions are not interruptable, and will cause the interrupt latency to increase. The only practical problem concerns a loop followed by a two-word instruction while waiting for an interrupt. The loop may consist of a branch instruction or an absolute or relative jump back to itself like this:

```
loop: rjmp loop
<Two-word instruction>
```

In this case, a dead-lock situation arises.

Problem Fix/Workaround

In assembly, insert a nop instruction immediately after a loop to itself. The problem will normally be detected during development. In C, the only construct that will give this problem is an empty "for" loop; "for(;;)". Use "while(1)" or "do{} while (1)" to avoid the problem.

5. Interrupts Abort TWI Power-down

TWI Power-down operation may be aborted by other interrupts. If an interrupt (e.g., INT0) occurs during TWI Power-down address watch and wakes the CPU up, the TWI aborts operation and returns to its idle state.

Problem Fix/Workaround

Ensure that the TWI Address Match is the only enabled interrupt when entering Power-down.

4. TWI Master Does not Accept Spikes on Bus Lines

When the part operates as Master, and the bus is idle (SDA = 1; SCL = 1), generating a short spike on SDA (SDA = 0 for a short interval), no interrupt is generated, and the status code is still F8 (idle). But when the software initiates a new start condition and clears TWINT, nothing happens on SDA or SCL, and TWINT is never set again.

Problem Fix/Workaround

Either of the following:

- 1. Ensure that no spikes occur on SDA or SCL lines.
- 2. Receiving a valid START condition followed by a STOP condition provokes a bus error reported as a TWI interrupt with status code \$00.
- 3. In a Single Master systems, the user should write the TWSTO bit immediately before writing the TWSTA bit.

3. TWCR Write Operation Ignored

Repeated write to TWCR must be delayed. If a write operation to TWCR is immediately followed by another write operation to TWCR, the first write operation may be ignored.

Problem Fix/Workaround

Ensure at least one instruction (e.g., nop) is executed between two writes to TWCR.

2. PWM not Phase Correct

In Phase-correct PWM mode, a change from OCRx = TOP to anything less than TOP does not change the OCx output. This gives a phase error in the following period.

Problem Fix/Workaround

Make sure this issue is not harmful to the application.

1. TWI is Speed Limited in Slave Mode

When the two-wire Serial Interface operates in Slave mode, frames may be undetected if the CPU frequency is less than 64 times the bus frequency.

Problem Fix/Workaround

Ensure that the CPU frequency is at least 64 times the TWI bus frequency.

Change Log

This section containes a log on the changes made to the data sheet for ATmega163. All refereces to pages in Change Log, are referred to this document.

Changes from Rev. 1142C-09/01 to Rev. 1142D-09/02

1. Added "Not Recommend for New Designs. Use ATmega16.".

Changes from Rev. 1142D-09/09 to Rev. 1142E-02/03

- 1. Updated Table 52, "Boot Reset Fuse," on page 136.
- 2. Corrected pin numbers in Figure 62 on page 113.
- 3. Corrected a constant in the Boot Loader code example on page 141.
- 4. Changed max bit rate for the TWI from 400 kHz to 217 kHz.
- 5. Removed redundant and harmful loop in a code example for Slave Receiver mode for the TWI on page 96.
- 6. Added AGND and AVCC in Figure 81 on page 145 and Figure 86 on page 154.
- 7. Updated the "Packaging Information" on page 12.
- 8. Added "Erratas" on page 14.
